Blood donation during the pandemic

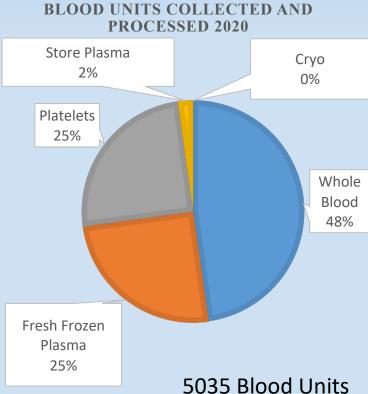

- Pre selection procedure to eliminate possible infected donors.
- Persons with possible direct contact with Covid Patient are temporarily deferred.
- Positive Covid -19 donors are deferred for 14 days after their last negative test result.
- Donors with Pending Covid-19 test result have been deferred until the results are completed.
- Delay in the Blood donation process, proper sanitation before and after a donation.
- Abide with Social Distancing protocols, encourage donations by appointment.
- Most donation were replacement.
- Healthy repeated donors were recall and collected.
- Blood drives were held on unaffected areas such as the rural communities.
- Blood drives were double before the first case to hit the country.

Measures for donor safety

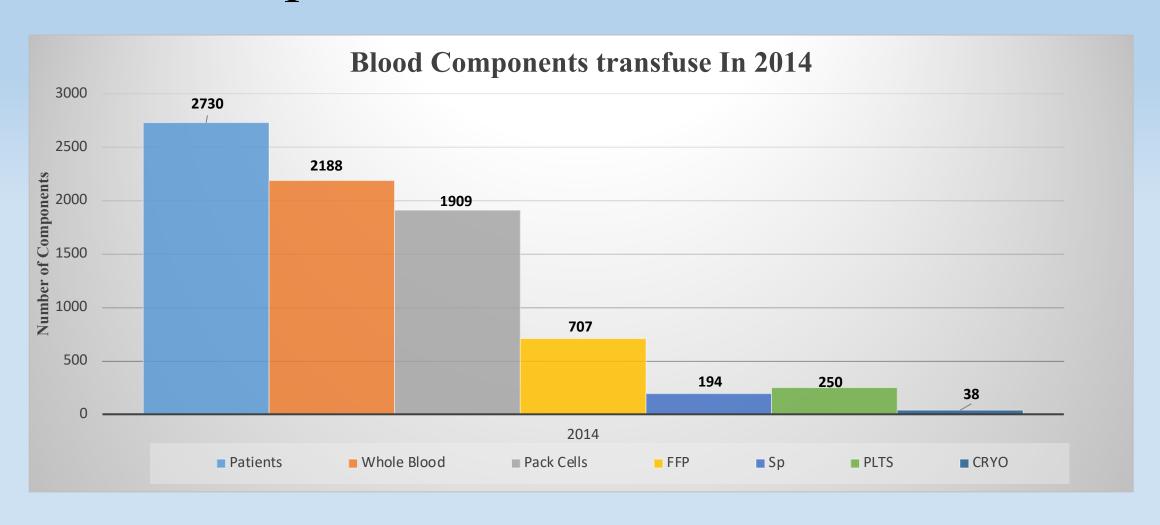

- Environmental decontamination.
- Temperature check
- Sanitation of all materials used before and after donation
- Provide hand sanitization.
- Emphasize physical distancing.
- Education of staff about Covid-19 and daily monitor temperature check.

Efficiency of Blood Banks.

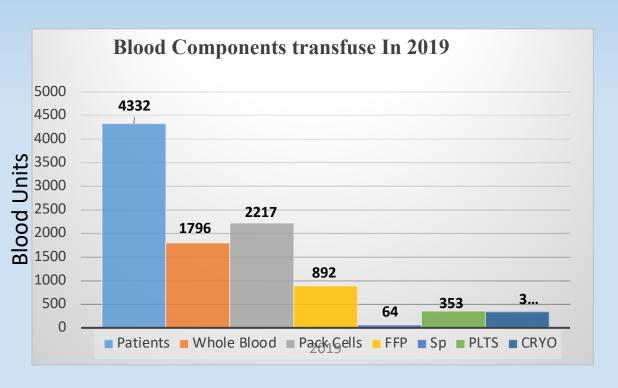

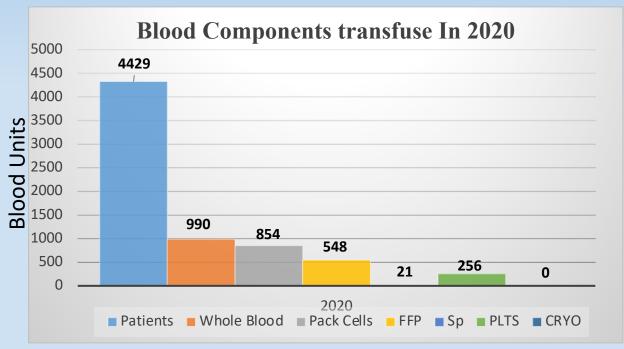

Number of patients Transfused in 2014.

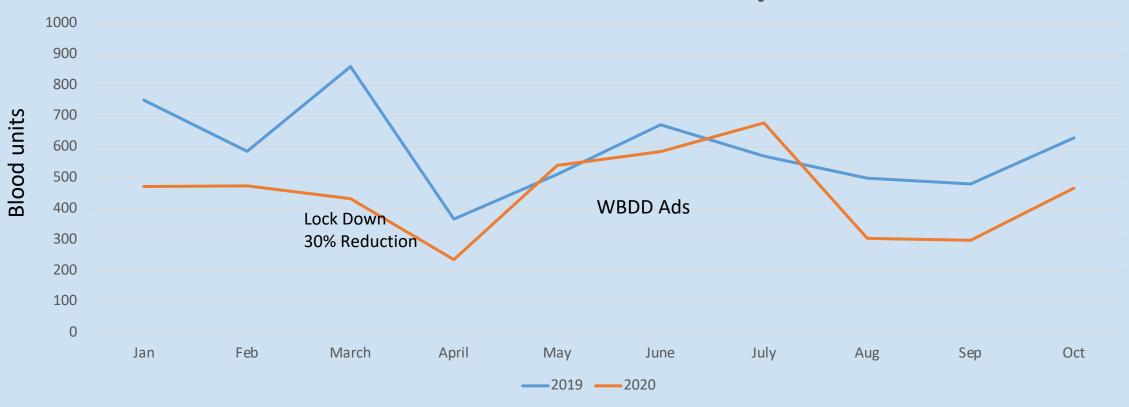

Number of patients Transfused in 2019 Vs 2020.

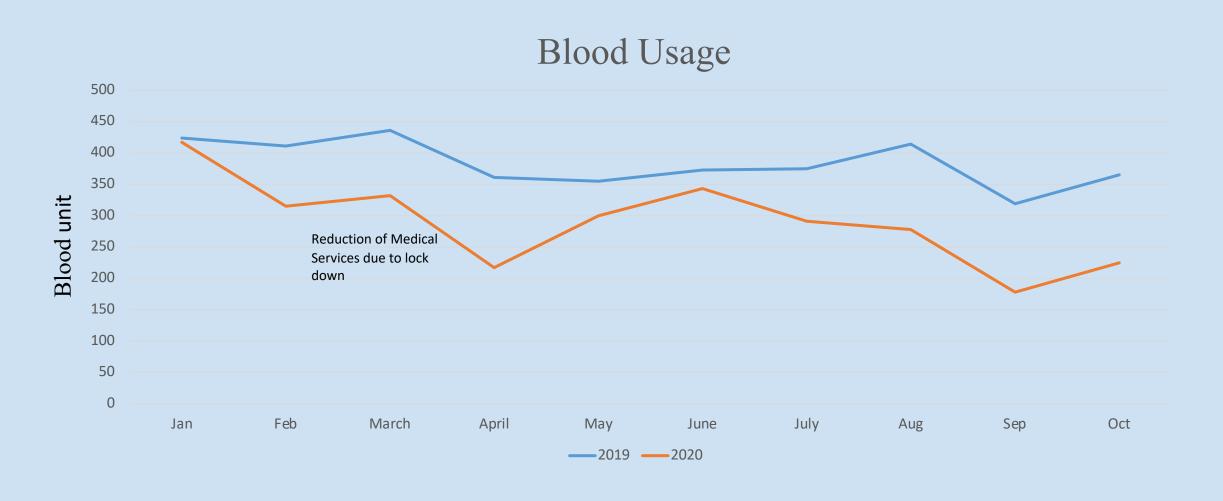

Covid-19 Impact on Blood Bank Blood Reserve.

Blood Collection History

Blood Demand during Covid-19.

Blood supply, results and lessons learned.

- There was a 20% reduction of blood collection, however the blood supply was steady.
- The BNBTS was able to meet the demand, as most hospitals went into emergency mode, because of the Lock down there was 95% reduction of crime and violence.
- Base on preparation and appropriate decision we were able to maintain our blood stock and thus survive the lockdown period and the course of the pandemic as it unfolds.
